

The Mayer, Aldermen, and Burgesses of the Berough of Christchurch.

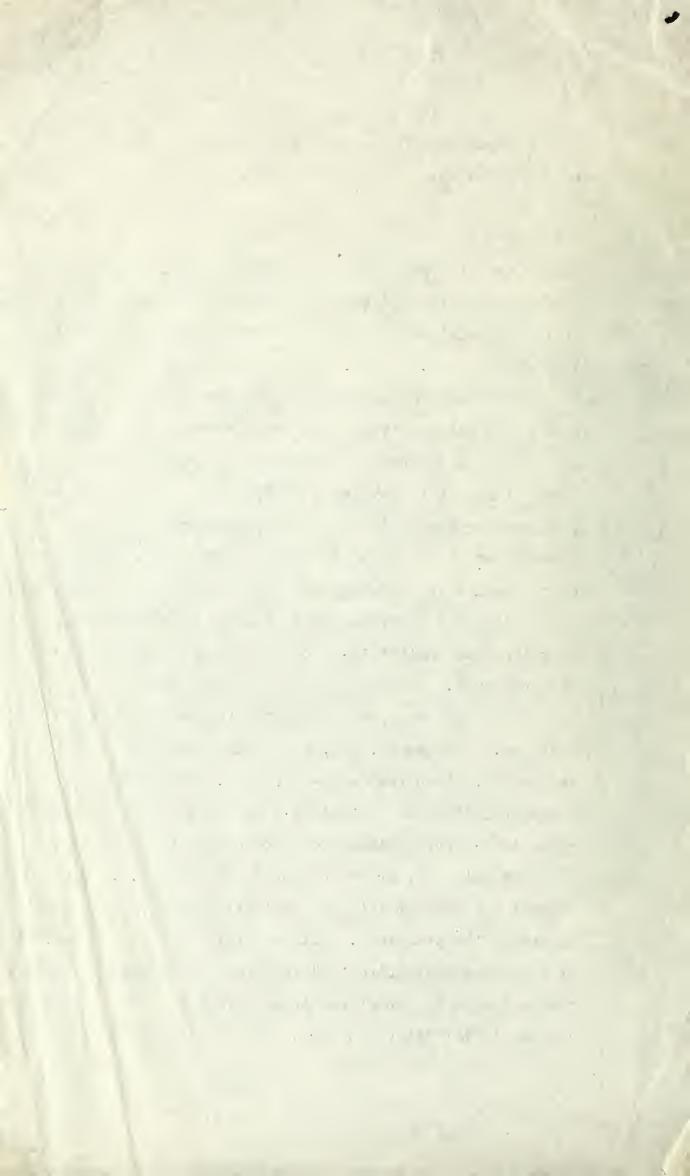

Gentlemen,

The number of births and deaths are those registered during the Calendar year, and are corrected for inward and cutward transfers. The causes of death in the District relate to civilians only. The number of births belonging to the District was 118, legitimate 107, illegitimate 11. Males 66. Females 52, and, calculated on the population 6964, gives the Birth-rate of 16.9 per 1000 of the total population as against 16.3 during the year 1924 and against 18.3 for England and Wales during the year 1925.

The number of deaths belonging to the District was 62, Males 34. Females 28, and, calculated on the above population, gives the death-rate of 8.9 per 1000 of the total population as against 11.0 during the year 1924 and against 12.2 for Emgland and Wales during the year 1925.

The natural increase of the population, i.e., the balance between natality and mortality was 56, as against 56 during the year 1924. All the deaths were certified.

No death was attributed to "Diarrhoea &c." under two years, and is in great measure due to mothers having become more learned in the art of nurture.

Christchurch Urban Sanitary District.

Birth-rate, Death-rate, and Analysis of Mortality during the Year 1925. Population estimated by the Registrar-General has been used for

the purposes of this Table.

The low general death-rate, the low infant death-rate, and the absence of any death from diarrhoea and enteritis under two years of age for two years in succession are matters for congratulation.

One death occurred within the District as a result of child-birth, viz:- puerperal sepirs. sepsis.

Infant death-rate, measured by the proportion of deaths under one year of age to registered births was 25.4, as against 26.7 in the preceding year and against 75 for England and Wales during 1925 per 1000. There were three deaths "under one year," and all were of legitimate infants. Two were attributed to whooping-cough and one to pneumonia.

Cancer accounted for 12 deaths (Males 7. Females 5) against 6 deaths during the preceding year.

Tuberculosis. I received 10 notifications as follows:Form A. 8. Form D. 7. and Form C. 4. Fifteen were
tuberculosis of Respiratory system and four other tuberculous
diseases, and all occurred in separate houses. Two deaths
were attributed to the respiratory system, and one to
"other tuberculous diseases."

Preventive measures. Examination of sputum &c., at County Laboratory, Sanatorium treatment, attendance at the Dispensary, Brockenhurst, provision of shelters and disinfectant, supply of sputum flasks, disinfection of infected rooms and all articles exposed to infection after death or change of residence, visitation of infected houses, and appropriate instructions were given as to the preventive measures to be adopted.

Institutional treatment has its chief purpose in

Digitized by the Internet Archive in 2017 with funding from Wellcome Library

https://archive.org/details/b29111584

education, and should be limited to a brief period of tuition in the manner of life suitable to the tuberculcus individual with one proviso:— that the individual having learned what manner of life he should lead, returns to conditions where he can carry it out. Tuberculosis is primarily a disease of environment, to arrest it there must be an improvement in the general hygienic conditions, and not least in the milk supply. The most reliable preventive measures in my opinion are good housing and good food well cooked.

Netifiable Infectious Diseases. Sixty-seven cases were notified in forty-seven houses.

Diphtheria. Sixteen cases were notified in fifteen houses, and fifteen cases were removed to Hospital.

Officer swabbed 197 school children with the result that two carriers were discovered.

Influenza was very prevalent among school-children and necessitated the closure of one school.

Scarlet Fever. Four cases were notified in three houses and one was removed to Hospital.

Pneumonia. Eleven cases were notified in six houses. Of these cases six were notified at the Union Workhouse..

Erysipelas. Seven cases were notified in seven houses.

Chicken-pox. Twenty-four cases were notified in fourteen houses. Eleven cases occurred at the Cottage Homes.

Opthalmia Neonaterum. This case was notified at the Union Infirmary.

Puerperal Fever. Two cases occurred in two houses, one of which proved fatal.

 Encephalitis Lethargica. One case was notified and removed to a nursing home and proved fatal.

Enteric Fever. One case was notified at a grocer's shop and was removed to Hospital. The girl, aged 12 years, left home on 29th December and returned home on 11th January, and was first medically attended on January 15th. She had not partaken of any uncooked vegetables, nor any kind of fish at home. The milk supply was not under suspicion and the confectionery was made at home. The water supply was derived from a shallow well. A sample of the water was submitted to a chemical and bacteriological examination at the County Laboratory and was pronounced to be fit for drinking purposes. An ex-soldier resided in the house but he had no history of having suffered from enteric fever.

The preventive measures in operation are:- Removal to Hospital, isolation at Home, quarantine and bacteriological examination of contacts, exclusion of children from school, detailed instructions were given to Head Teachers and Heads of infected households as to the measures to be taken to prevent spread of infection. I notified Head Teachers and the Sanitary Inspector of each infected household. The School Medical Officer issued to Head Teachers "Form H. 6a" to notify the Medical Officer of Health of infectious disease occurring among school Children, on receipt of which I visited Schools and Homes of children and took appropriate action, disinfection of rooms and all articles exposed to infection by the Sanitary Inspector, supply of disinfectant and rectification of Sanitary defects. I received 26 notifications on "Form H. 6a."

The method of disinfection is:- all linen and other washable articles are saturated with a spray of (1-50)

,

Formalin and left for twelve hours, then rinsed in cold water, and finally washed in boiling water. The pillows, mattress and carpets (unless soiled by infective discharges, then burned) are well sprayed with the Formalin solution. After measures of disinfecting a room have been taken, the wall-paper (especially if torm, soiled, or loose) is stripped from walls and burned, the room has its ceiling and walls thoroughly washed or limewashed. The floor and woodwork are also washed with soap and water.

The Borough is relying upon other Sanitary Authorities

for Isolation Hospital accommodation. This arrangement

for obvious reasons may come to an end at any time. The

Council should therefore proceed to provide the much-needed

Isolation Hospital for the District especially under

existing circumstances, i.e., overcrowding of dwellings

with consequent spread of infection. The Council have now

subsidized beds at the Alderney Hospital Poole and also

means of transport.

Public Elementary Schools.

I inspected the Schools. The W.C's at two required to be cleaned and lime-washed. Garments of vermincus children require to be separated from those of non-vermincus children in the cloak-rooms. Children under five years of age should be excluded from school during the prevalence of infecticus disease. Much may be done to prevent the spread of infecticus disease by due attention to the sanitation and ventilation of school-rooms and cloak-rooms. Frequent and thorough washing of class-rooms and cloak-rooms is an efficient means of removing both dust and infection. Dry sweeping on the other hand tends to scatter dust. Medical

 Inspection of school children is carried cut by the County Medical Officer. The Health reformers tell us that the state of school-children's teeth is a national scandal, and they are calling for a good dental service, Little headway will be made towards the banishment of dental disease unless the simple rules of prevention are inculcated. But are Teachers instructed to see that children come to school with clean teeth, and do they insist as far as they can on their instructions being obeyed?

Bakehouses. I inspected five bakehouses, two required to be cleansed and linewashed and the dung removed from the premises.

Dairies, Cowsheds and Milkshops.

Milk Shops. I inspected three. The shops and milk vessels were clean. The receptacles containing milk in the shops were covered.

Milk Stores. I inspected three. The stores and vessels were clean. One contained extraneous things.

Cowsheds. I inspected nine and seven required to be cleaned and limewashed. Two milk vessels were unfit to contain milk owing to the rusty condition of interior.

Coveralls required to be provided for milkers. The yards adjoining sheds were in an unwholesome condition owing to the large accumulation of solid and semi-fluid dung.

Slaughter-houses. I inspected two slaughter-houses; the notices were affixed. One required to be cleansed and limewashed and the offal and extraneous things removed. No action was taken under Section 117 of the Public Health Act 1875. The Meat-Inspector is a qualified Veterinary

. . 4 to 19 to 10 to 1

Surgeon, and he seized and condemned 190 lbs. of pork as unsound and unfit for human consumption owing to tuberculosis.

Factory and Workshops Act. I inspected a laundry and the address of an "cutworker." Both were in a satisfactory sanitary condition. The Abstract of the Act was affixed and the Regulations were complied with.

Foods and Drugs Act. Fifteen samples were taken during the year and thirteen were genuine, Viz:- bloater-paste, brandy, butter, flour (self-raising), lemon-curd, malt vinegar, new milk (5), spirit of nitre and whiskey. Two informal samples of whiskey were unsatisfactory. No case of food poisoning came to my knowledge during the year. These Acts are administered by the County Council.

Canned Foods. It is only by efficient sterilization that any food stuff can be rendered absolutely safe when preserved. The temperature required raises the point whether the containers themselves will stand the heat required, particularly if made of glass. The advantages of tins are that they are cheaper, they are more readily sterilized with less risk of damage or fracture, and it is easier to make them hermetically tight. Therefore the risk of harmful bacterial infection including botulism is decidedly less if tin containers are given the preference to glass. No application was made for licences permitting the use of the designations "Grade A. (Certified Milk)" and "Grade A. Milk." For consumption in industrial towns, there is much to be said for pasteurised milk, but pasteurisation cannot make dirty milk clean; to be wholesome and to have keeping properties the milk must itself be clean.

4 and the second s the same of the sa AC.

The Water Supply of the District is derived from Waterworks and the supply is constant.

I made sixty visits of inspection in various parts of the District. These are exclusive of re-visits to infected houses and schools &c., and the following are some of the sanitary defects discovered, and reported to the Sanitary Authority: - bedrocm without throughventilation, a nuisance caused by the continuous flow of offensive sewage through the drain at rear of cottages and discharged into a ditch close by; three cases of overcrowding owing to shortage of houses. There is a shortage of houses of modest size to meet the requirements of the weekly wage-earner. So long as any section of the population is badly housed, the Country cannot rest satisfied. The house is a matter that touches the comfort of every man and woman, and the welfare of the children. No action was taken during the year under "Rat and Mice Order." Whatever else is done at least all storeplaces of food should be rat-procfed. Notification of Birth Act, Maternity and Child Welfare Act, Midwives Act, Venereal Diseases Act 1917, are administered by the County Council.

Area of the District (acres) 2800.

Population of the District. R.G. (1921) 6910.

Number of families or separate occupiers (1921) 1579.

Number of inhabited houses (1921) 1475.

A Summary of the work carried out by the Sanitary Inspector is appended to the Report.

I am, Gentlemen,

Your obedient Servant,

P. der legale

Medical Officer of Health.

17th July 1926.

Form 572.

Nov., 1925.

This Table is enclosed, by request of the Secretary of State, for the guidance and convenience of Medical Officers of Health in preparing that part of their Annual Report which relates to factories, workshops and workplaces. It is not intended to supersede the fuller statement which is desirable in the text of the Report, but to provide for uniformity in the presentation of certain particulars which lend themselves to statistical treatment.

Further copies can be supplied on application to the Chief Inspector of Factories, Home Office, London, S.W.1.

Medical Officer of Health.

Date 23 Luly 1926.

Note.—The Factory and Workshop Act, 1901 (s. 132), requires the Medical Officer of Health in his Annual Report to the District Council to report specifically on the administration of that Act in workshops and workplaces, and to send a copy of his Annual Report, or so much of it as deals with this subject, to the Secretary of State (Home Office). If the Annual Report is presented otherwise than in print, it is unnecessary to include in the copy sent to the Home Office the portions which do not relate to factories, workshops, workplaces or homework.

GENERAL REMARKS:— The Housing shortage still continues, It is impossible to deal with the cases of houses unfit until other accommodation in the form of small properties is awailable. It is hoped the Council's further scheme of 26 Houses will assist in this direction.

Newy J. Farme

Medical Officer of Health.
